LEOI-32 Experimental System for Crystal Magneto-Optic Effect

- Easy operation
- Precise measurement
- Stable base
- Complete solution

The magneto-optic rotation effect of a crystal, also called the Faraday effect, describes the effect of polarization rotation of an optical beam going through a layer of magneto-optic material. It plays an important role in optical experiments.

Using this apparatus, the following experiments can be conducted:

1. Observe the magneto-optic rotation effect of a material under test.
2. Understand the flow direction of a magnetic current vs the polarization rotation direction of a Faraday rotator.
3. Calculate the Verdet constant.
4. Demonstrate optical communication using magneto-optic modulation technique.

Note: Oscilloscope not included
Experimental Objectives

1. Observe magneto-optic modulation effect
2. Measure modulation depth and range of modulated Faraday rotation angle
3. Measure range of modulated Faraday rotation angle vs magnetic induction
4. Measure Faraday rotation angle vs DC exciting current
5. Demonstrate optical communication using magneto-optic modulation
